## Summary Sheet

As an aid to reviewers, this Summary Sheet has been included to outline the various study parameters utilized in this report. Although a full explanation of the study methodologies is included in the text of the report, this summary can serve as a useful reference for reviewers.

**Applicant:**

Woodland Pacific, LLC

**Development Size/Type:**

540 high-rise apartment units

**Parking:**

675 parking spaces

**Applications:**

City of Stamford Zoning Board

Office of the State Traffic Administration (OSTA) Administrative Decision Review

**Build Year:**

2019

**Expected Trip Generation:**

Morning Peak Hour – 118 trips (28 entering, 90 exiting)

Afternoon Peak Hour – 137 trips (84 entering, 53 exiting)

**Capacity Analysis:**

Technique – 2000/2010 Highway Capacity Manual

Execution – Synchro Professional Software, Version 10.0

## 1 Introduction

Woodland Pacific, LLC proposes to construct a new residential development with 540 apartment units on the parcel bounded by Woodland Avenue to the north, Pacific Street to the east, Walter Wheeler Drive to the south, and South Commons Road to the west, as shown in *Figure No. 1 of Appendix B*. The site is located to the south of Interstate 95 and the Stamford Transportation Center in the south end of Stamford and has an expected build year of 2019.

Fuss & O'Neill has been retained to study the impact of the proposed development on traffic conditions throughout the adjacent roadway network. This report has been prepared to document the findings of the study and is being submitted to the City of Stamford Zoning Board in support of a land use application. This report is also being submitted to the Office of the State Traffic Administration (OSTA) in support of an Administrative Decision Review.

## 2 Existing Condition

### 2.1 Site of Development

The site of development consists of several lots that were historically used as a waste transfer facility. The site will be accessible to residents from Pacific Street and South Commons Road with additional loading dock access to Woodland Avenue and Walter Wheeler Drive. The site is currently zoned partially as part of the "South End Redevelopment District South" with the remainder falling in a "General Industrial", "Multiple Family Residence" and "Community Business" zones. Driveways to the site will be strategically located to provide the safest access to the site given its proposed configuration.

### 2.2 Adjacent Roadway Network

The adjacent roadway network consists of the following roadways:

- Pacific Street
- Atlantic Street
- Woodland Avenue
- Walter Wheeler Drive

**Pacific Street** runs north to south through the study area beginning at Harbor Point Road, just west of Washington Boulevard, in the south and ending just north of Dock Street. It is a two lane road with on street parking on both sides and several CT Transit bus stops. It is classified by the Connecticut Department of Transportation (CDOT) as an urban collector roadway along a portion of its length in the vicinity of the site. Lane widths vary from 12 to 15 feet based on the bike lane and shoulder configuration. The speed limit on this roadway is 30 miles per hour. Land uses along the roadway consist of a mix of mixed-use, residential and industrial land uses.

**Atlantic Street** also runs north to south through the area of study from Broad Street in the north to Washington Boulevard in the south. It is a two lane road with painted shared lane markings for cyclists

and lane widths that vary between 15 and 16 feet. On-street parking and CT Transit bus stops are located along the street on both sides. This roadway is also classified as an urban collector with a speed limit of 25 miles per hour. Land uses along the roadway consist of a mix of mixed-use, residential and industrial land uses.

**Woodland Avenue** is a local urban road that runs east to west between Atlantic Street and Pacific Street. It is a two lane road with on-street parking and shared lane markings for bicyclists on both sides. Lanes are 13 feet wide and the speed limit is 25 miles per hour. Woodland Avenue provides access to primarily residential land uses.

**Walter Wheeler Drive** is a local urban roadway that runs east to west between Atlantic Street and Pacific Street. It has a speed limit of 25 miles per hour and a lane width of 11 feet in the westbound direction with a lane width of 18 feet in the eastbound direction. The eastbound lane is wider due to the inclusion of on-street parking and shared lane use markings for bicyclists. Land use along this road primarily consists of the “South End Redevelopment District south” zone.

---

## 2.3 Study Area Intersections

The following study area intersections were reviewed:

- Pacific Street at Walter Wheeler Drive/East Walnut Street
- Pacific Street at Woodland Avenue/Ludlow Street
- Atlantic Street at Woodland Avenue
- Atlantic Street at Walter Wheeler Drive

The intersection of Pacific Street and Walter Wheeler Drive/East Walnut Street is four-way stop-controlled intersection with a one-lane approach from each direction. Sidewalks are provided on each leg of the intersection along with three crosswalks, excluding the northern crossing of Pacific Street. Land use adjacent to the intersection is residential and mixed use.

The intersection of Pacific Street and Woodland Avenue/Ludlow Street is a four-way signalized intersection. The approaches from all directions except for Ludlow Street are one-lane approaches which allow for all turning movements in any direction. Ludlow Street is a one-way road traveling westbound, toward the intersection. Ludlow Street provides a two lane approach with a dedicated left-turn lane and a shared through/right turn lane. Sidewalks are provided on each leg of the intersection along with crosswalks across all four lanes with shared lane markings, “sharrows” continuing down Woodland Avenue towards Atlantic Street.

The intersection of Atlantic Street and Woodland Avenue is an unsignalized “T” style intersection. Northbound and southbound traffic moves freely on Atlantic Street while westbound traffic from Woodland Avenue is controlled by a stop sign. Each approach carries one lane of traffic as well as shared lane markings, “sharrows”, to encourage multiple modes of transportation.

The intersection of Atlantic Street at Walter Wheeler Drive is an unsignalized “T” style intersection. Northbound and southbound traffic moves freely on Atlantic Street while westbound traffic from

Walter Wheeler Drive is controlled by a stop sign. Atlantic Street southbound and Walter Wheeler Drive carry one lane of traffic, while Atlantic Street northbound carries one through lane and one right turn lane between Washington Blvd and Walter Wheeler Drive. Each of these approaches also carry shared lane markings, “sharrows”, to encourage multiple modes of transportation.

---

## 2.4 Existing Traffic Volumes

The greatest potential for traffic impact on the roadway network by the proposed development will occur during the morning and afternoon peak hours, the periods when commuter and/or high-rise apartment related trips are at their highest levels. These peak hours were subsequently analyzed for impacts. In order to determine the traffic impact of the proposed development on adjacent street traffic, the CTDOT approved 2016 morning and afternoon weekday peak hour turning movement volumes for Stamford’s South End were obtained from the CTDOT Planning Bureau.

# 3 Background Traffic Conditions

---

## 3.1 CTDOT Approved Volumes

Fuss & O’Neill contacted the Connecticut Department of Transportation (CTDOT) Bureau of Planning and the City of Stamford Transportation, Traffic, & Parking Department to obtain an approved set of traffic volumes for the south end of the City of Stamford from 2016 and 2018. These volumes incorporate various roadway projects and developments in the area that are either proposed or being constructed. These volumes were balanced and used as a base for analyzing the impact of the proposed development on the study intersections. These approved volumes will be considered the Existing 2018 morning and afternoon peak hour traffic volumes, and are shown in *Figure No. 2 of Appendix B*.

---

## 3.2 Planned Roadway Improvements

Fuss & O’Neill contacted CTDOT as well as the City of Stamford’s Transportation, Traffic & Parking Office in order to determine if any planned roadway improvements to the study network were to take place prior to the proposed build year of 2019. While several roadway improvements are ongoing in the vicinity of Interstate 95 in Stamford, no roadway improvement projects were identified that will impact traffic patterns at any of the study area intersections for this development.

# 4 Proposed Conditions

---

## 4.1 Development and Parking

The proposed development will consist of one high-rise building with 540 residential units comprised of a mix of studio, one-, two-, and three-bedroom units. The development will be bounded by Woodland Avenue to the north, Pacific Street to the east, Walter Wheeler Drive to the south, and South Commons Road to the west. A total of 675 parking spaces are proposed to be provided.

---

## 4.2 Site Access and Circulation

The site is proposed to have access provided to residents via two full access driveways that will lead to the parking garage on the interior of the building. Additionally, there will be two loading docks that will access Woodland Avenue and Walter Wheeler Drive, respectively. All four of these driveways are proposed to be stop controlled.

---

## 4.3 Trip Generation

The expected site generated traffic data was calculated using existing empirical data from the Institute of Transportation Engineers (ITE) publication Trip Generation, 10th edition, 2017. This publication is an industry-accepted resource for determining trip generation.

Trip generation for the proposed development was estimated based on the proposed number of dwelling units. Using TE Code 222 – Multifamily Housing (High Rise).

Based on the ITE average rates for this land use, the proposed development would generate a total of 168 trips (40 entering, 128 exiting) during the morning peak hour and 195 trips (119 entering, 76 exiting) during the afternoon peak hour.

The proposed site is less than three-quarters of a mile from the Stamford Transportation Center (STC), therefore reducing vehicular trip demand at this site. As such, a transit oriented development (TOD) credit is also applicable to the trip generation for this site. In collaboration with the CTDOT Bureau of Policy and Planning, a rate of 30% is being used for the TOD credit.

After taking the aforementioned credits into account, the proposed development is projected to generate a total of 118 trips (28 entering, 90 exiting) during the morning peak hour and 137 trips (84 entering, 53 exiting) during the afternoon peak hour. A summary of the peak hour trip generation information for the proposed development is provided in *Table 1* of *Appendix A*.

---

## 4.4 Trip Distribution

The distribution of traffic entering and exiting the proposed site was applied to the road network based on the existing regional traffic distributions and the layout of the adjacent roadway network. During the peak hours, the following arrival/departure distributions of traffic are anticipated:

- 50% from Pacific Street to the north
- 30% from Atlantic Street to the north
- 15% from Pacific Street to the south
- 5% from Atlantic Street to the south

A regional arrival/departure distribution for the new site generated traffic traveling to and from the project site is shown in *Figure No. 4* of *Appendix B*.

---

## 4.5 Combined Volumes

The site generated traffic was distributed to the roadway system based on the arrival/departure distributions with the results shown in *Figure No. 5 of Appendix B*. These volumes were then added to the background volumes to yield the year 2018 peak hour Combined traffic volumes shown in *Figure No. 6 of Appendix B*.

---

# 5 Analyses

---

## 5.1 Crash Data Analysis

Crash data was gathered from University of Connecticut Crash Data Repository for the following intersections:

- Pacific Street at Walter Wheeler Drive/East Walnut Street
- Pacific Street at Woodland Avenue/Ludlow Street
- Atlantic Street at Woodland Avenue
- Woodland Avenue
- Pacific Street from Walter Wheeler Drive to Woodland Avenue
- Atlantic Street at Walter Wheeler Drive

The records were gathered for the most recent three years of available data, 2015 through 2017. A summary of the crash data per intersection and roadway segment is provided in *Table 2 of Appendix A*. Copies of the crash data have been provided in *Appendix E*.

At the intersection of Pacific Street and Walter Wheeler Drive/East Walnut Street, there were two reported crashes during the three year study period. One of the crashes was reported to be an angle crash, and the other was a rear-end collision.

At the intersection of Pacific Street and Woodland Avenue/Ludlow Street, there were six reported crashes during the three year study period. The crashes included two same-direction sideswiping collisions, two rear-end collisions, one angle collision, and one collision between a vehicle and a pedestrian.

At the intersection of Atlantic Street and Woodland Avenue, there was one crash reported during the three year period, which was a rear-end collision.

Along Woodland Avenue, there were four crashes reported during the three year study period. The crashes included two rear-end collisions, one angle collision, and one opposite-direction sideswiping collision.

Along Pacific Street from Walter Wheeler Drive to Woodland Avenue, there were two reported crashes during the three year study period. One of the crashes was a same-direction sideswiping collision and the other was a rear end collision.

At the intersection of Atlantic Street at Walter Wheeler Drive, there were three reported crashes during the three year study period. Two of the three crashes were angle collisions, while one was a single vehicle colliding with a fence.

All of the crashes described above resulted in property damage only. The crash between the vehicles and pedestrian at the intersection of Pacific Street and Woodland Avenue is listed to have a possible injury but none were ever officially reported. Therefore, the type, frequency, and severity of the crashes reported are not abnormal for the type of roadways, volume of traffic and current land use in the study area.

---

## 5.2 Intersection Sight Distance Analysis

Intersection sight distances were evaluated at the proposed site driveway locations in accordance with criteria set forth in the 2003 CTDOT *Highway Design Manual*.

All site driveways have been designed to have an unobstructed sightline beyond the nearest intersection in either direction. The sight distances will exceed CTDOT criteria for safe egress.

---

## 5.3 Intersection Capacity Analysis

Capacity analyses for both signalized and unsignalized intersections were conducted using Synchro Professional Software, version 10.0.

In discussing intersection capacity analyses results, two terms are used to describe the operating condition of the road or intersection. These two terms are volume to capacity ratio (v/c) and level of service (LOS).

The v/c ratio is a ratio of the volume of traffic using an intersection to the total capacity of the intersection (the maximum number of vehicles that can utilize the intersection during an hour). The v/c ratio can be used to describe the percentage of capacity utilized by a single intersection movement, a combination of movements, an entire intersection approach, or the intersection as a whole.

LOS is a measure of the delay experienced by stopped vehicles at an intersection. LOS is rated on a scale from A to F, with A describing a condition of very low delay (less than 10 seconds per vehicle), and F describing a condition where delays will exceed 50 seconds per vehicle for unsignalized intersections and 80 seconds per vehicle for signalized intersections. Delay is described as a measure of driver discomfort, frustration, fuel consumption, and lost travel time.

LOS is generally used to describe the operation (based on delay time) of both signalized and unsignalized intersections, while v/c ratio is applied to signalized intersections only. These definitions for v/c ratio and LOS, as well as the methodology for conducting signalized and unsignalized intersection capacity analyses, are taken from the "2000 Highway Capacity Manual" published by the Transportation Research Board.

FUSS & O'NEILL

In discussing two way stop controlled unsignalized intersection capacity analyses, LOS is used to provide a description of the delay and operational characteristics of the turns from the minor street (stop sign controlled) to the major street, and turns from the major street to the minor street. Through vehicles are not delayed by the minor street and do not experience delay, therefore they are not rated with a level of service.

In discussed all-way stop controlled intersection capacity analysis, LOS provides a description of the delay for each approach as well as the overall intersection.

Using the above referenced methodologies, morning and afternoon peak hour capacity analyses were conducted at the following signalized intersection:

- Pacific Street at Woodland Avenue/Ludlow Street

Morning and afternoon peak hour capacity analyses were also conducted at the following unsignalized intersections:

- Atlantic Street at Woodland Avenue
- Atlantic Street at Walter Wheeler Drive
- Commons Park S at West Driveway
- Pacific Street at East Driveway
- Commons Park S at Woodland Avenue
- Pacific Street at Walter Wheeler Drive/E Walnut Street

*Tables No. 3 and 4 of Appendix A* present a summary of the levels of service at the unsignalized and signalized intersections for both the background and combined condition traffic volumes; copies of the analysis worksheets can be found in *Appendices C and D*, for the morning and afternoon peak hours, respectively.

The determination of the traffic impact from the proposed development is made through a comparison of the background conditions LOS (without the proposed development) versus the combined conditions LOS (with the proposed development).

The capacity analysis revealed that all study intersections and the proposed site driveways will operate efficiently at LOS B or better during both the morning and afternoon peak hours of traffic in the combined condition, with the exception of the northbound movement at the intersection of Pacific Street at the east site driveway. This movement will operate at an acceptable LOS C, with adequate bypass width for cars to move around any queueing vehicles waiting to turn left into the proposed development.

Based on the conducted capacity analysis, the proposed roadway configuration is adequately suited to handle the added demand of the traffic generated by this development.

## 6 Conclusions & Recommendations

The purpose of preparing this Traffic Impact Study is to identify the impact of the proposed Woodland Pacific Development site generated traffic on its surrounding roadway network. The study efforts have indicated that the proposed residential use will generate a total of 118 trips (28 entering, 90 exiting) during the morning peak hour and 137 trips (84 entering, 53 exiting) during the afternoon peak hour, factoring in a 30 percent trip generation credit due to the development's proximity to transit. The site's close proximity to the Stamford Transportation Center (STC) will serve to reduce the overall site generated traffic from this development.

The capacity analysis indicates that the additional traffic generated by the proposed development and associated roadway improvements will result in no significant change in level of service at any of the intersections in the vicinity of the site. Additionally, each of the unsignalized intersections in the study area, including all three site driveways, will operate acceptably at LOS C or better in both the morning and afternoon peak hours, with the majority of critical movements operating at LOS A or LOS B.

A review of intersection sight distance revealed that each of the proposed driveway locations meets the CTIDOT requirements for sight distance and they have been designed to provide full view beyond the nearest adjacent intersections.

A review of crash data history for the previous three years of available data yielded the conclusion that there were no identifiable crash patterns under the current roadway configuration.

Based on the results of the foregoing analysis, it is the professional opinion of Fuss & O'Neill, Inc. that the proposed development will not have a significant impact to traffic operations within the study area.
